Addresses clinical decision making in an algorithm format. Algorithms outline the key points in the decision making process. A brief text accompanies each algorithm to explain the significance of important points on the algorithm.

Expressly created to assist with decision making for surgical treatment of congenital heart defects, this new reference covers all relevant aspects. The Congenital Heart Defects are presented with each chapter devoted to a single malformation, with incidence, morphology, associated anomalies, pathophysiology, diagnosis (including clinical pattern, electrocardiogram, chest X-ray, echocardiogram, cardiac catheterization with angiography), indications for surgical treatment, details of surgical treatment, potential complications and literature references. Morphology, pathophysiology

and surgical treatment of the defects are explained with schematic drawings, while images taken from morphologic specimens, echocardiographic and angiographic investigations as well as from intra-operative photographs illustrate better than any words the key points of the decision-making process for the surgical treatment of congenital heart defects.

The diagnosis and management of congenital heart defects has rapidly evolved over the last few decades. In this third volume of the series entitled "Congenital Heart Defects: Decision Making for Surgery" Antonio Corno provides an up-to-date and comprehensive presentation of the new role that cardiac CT and MRI will play in the management of congenital heart defects. He has been ably assisted by a

cardiologist, Pierluigi Festa. The book provides a dazzling array of images derived by both techniques and covers the full range of congenital heart malformations. Both the pre-operative and post-operative usefulness of these techniques is presented: in the pre-operative period with regard to the details useful for choosing among all available surgical options; in the post-operative period for monitoring the follow-up and potential complications. There is no doubt that these techniques will be particularly helpful for older children and adults with congenital heart disease in assessing the late impact of a congenital heart malformation and the surgical repair or palliation which may have been undertaken years previously. The time is definitely right for a comprehensive presentation of these new diagnostic modalities and the way in which they will influence the field of congenital heart management. \* First and only volume

Decisions in Surgery series that covers surgical specialties. The volumes are multi-authored, containing brief chapters, each of which are devoted to one or two specific questions or decisions within that specialty that are difficult or controversial. The volumes are intended as a current and timely reference source for practicing surgeons, surgeons in training, and educators that describe the recommended ideal approach, rather than customary care, in selected clinical situations.

This text provides a comprehensive and state-of-the-art overview of the major issues specific to the surgical decision-making process. These include patient ' s anatomy and pathophysiology as well as the magnitude of the injury at hand, the surgeon's own physiologic and mental status, training and experience, and many other factors such as creativity, leadership

skills, and overall "biochemistry" of the environment. The text reviews theoretical as well as objective information that surgeons use to make intraoperative decisions in situations, often with very limited data; decisions that will decide between a patient's living or dying, such as in trauma surgery and other complex surgeries. How surgeons choose one technical approach over another in these situations is covered. This book fills a critical need for resource materials on these topics and includes both theoretical as well as practical presentations of many typical patients seen in operating rooms around the world. *Surgical Decision Making: Beyond the Evidence Based Surgery* is written by academic and clinical practicing surgeons that face intraoperative decision situations on a daily basis and therefore provides a unique and valuable resource in the field for surgeons currently in training and for those already in clinical
